Amendments to the Specification

Replacement of the section of page 4, lines 16-19, paragraph 2.

Computer storage media may include volatile and non-volatile, removable and non-removable media implemented in any method or technology for storage of information; ~~such as computer readable instructions, data structures, program modules or other~~ data.

Amendments to the Claims

7. A computer storage media having computer executable instructions for routing messages, received by a mobile device, to an application of the mobile device, comprising:

- accessing a registry of the mobile device, wherein the registry includes data that indicates a priority of each of a plurality of prioritized providers with respect to one another; providing a plurality of prioritized providers on the mobile device in accordance with the priority indicated by the registry of the mobile device, wherein each provider is associated with a message type;
- receiving a message, on the mobile device, having a message type indicated by a character sequence in the message;
- routing the message to a first prioritized provider on the mobile device from a list of prioritized providers on the mobile device;
- associating the message with the first prioritized provider when the first prioritized provider recognizes the character sequence, wherein an application of the mobile device and associated with the first prioritized provider is informed that the message is

waiting without the application sending a query to receive an indication that the message is waiting;

formatting the message to the requirements of an application associated with the first prioritized provider, wherein formatting the message to the requirements of the application comprises removing the character sequence indicating the message type; routing the message to a second prioritized provider when the first prioritized provider does not recognize the character sequence; and associating the message with a default provider associated with a lowest priority when at least one of the plurality of higher prioritized providers does not recognize the message type.

8. The computer storage media of Claim 7, wherein associating the message with the first prioritized provider further includes further comprising:
waiting for the application to request the message; and
delivering the message to the application.

9. The computer storage media of Claim 8, wherein formatting the message to the requirements of the application further comprises:
providing access to the message to the first prioritized provider associated with the requesting application; and

the first prioritized provider associated with the requesting application formatting the message to the requirements of the application.

10. The computer storage media of Claim 8,
wherein associating the message with a provider, further comprises:
prioritizing the list of providers based on a priority level; and
providing access to the message to each of the prioritized providers in order of
priority until the message has been associated.

11. The computer storage media of Claim 10, wherein each of
the set of providers has a unique priority level.

12. The computer storage media of Claim 11,
wherein providing access to the message to each of the prioritized providers in order of
priority until the message has been associated, further comprises:
receiving a response from the highest level prioritized provider indicating if the
prioritized provider is associated with the message; and
associating the message with the highest level prioritized provider if the received
response indicates that the prioritized provider is associated with the message.

13. The computer storage media of Claim 12,
wherein associating the message with the prioritized provider if the received response

indicates that the prioritized provider is associated with the message, further comprises storing the message in a location associated with the prioritized provider.

14. A system for routing messages received by a mobile device to an application of the mobile device, comprising:
a processor and a computer storage media;
computer readable instructions stored on the computer storage media and executing on the processor;
a communication connection device operating under the control of computer readable instructions; and
a routing device operating under the control of the computer readable instructions and operative to perform actions, including:
accessing a registry of the mobile device, wherein the registry includes data that indicates a priority of each of a plurality of prioritized providers with respect to one another;
providing priority to the plurality of prioritized providers in accordance with the priority indicated by the registry of the mobile device, wherein each provider is associated with a message type;
recognizing a character sequence indicating the message type;
receiving a message on the mobile device having a provider indicator;
routing the message until at least one provider on the mobile device recognizes the provider indicator, wherein the message is routed according to a priority level of the

provider, wherein the provider having the first highest level of priority receives the message first, and wherein the message is routed to a provider having a second highest level of priority when the provider having the first highest level of priority does not recognize the provider indicator;

associating the message with at least one provider when the at least one provider recognizes the provider indicator;

associating the message with a default provider associated with a lowest priority when at least one of the plurality of higher prioritized providers does not recognize the message type;

formatting the message to the requirements of an application associated with the at least one provider, wherein formatting the message to the requirements of the application comprises removing the character sequence indicating the message type; delivering the message to an the application of the mobile device and associated with the at least one provider when the at least one provider recognizes the provider indicator, wherein the application is informed that the message is waiting without the application sending a query to receive an indication that the message is waiting.

Reasons for Allowance

Claims 1, 7 and 14 are directed towards a patentably distinct method, computer-readable storage medium and system for routing messages received by a mobile device to prioritized providers on the mobile device. Applicable prior art discloses routing messages to applications of the mobile device. However, Examiner asserts that the

Art Unit: 2153

prior art of record fails to teach or suggest the Applicant's feature which formats the message to the requirements of an application associated with the first prioritized provider, wherein the formatting the message to the requirements of the application comprises removing the character sequence indicating the message type. Furthermore, the prior art of record fails to disclose associating the message with a default provider associated with a lowest priority when at least one of the plurality of higher prioritized providers does not recognize the message type. Therefore, the Examiner asserts that this feature is patentably distinct and non-obvious over the prior art.

Claim 20 is directed towards a patentably distinct method for routing messages received by a mobile device to prioritized providers on the mobile device. Applicable prior art discloses routing messages to applications of the mobile device. However, Examiner asserts that the prior art of record fails to teach or suggest the Applicant's feature which formats the message to the requirements of an application associated with the first prioritized provider, wherein the formatting the message to the requirements of the application comprises removing the character sequence indicating the message type. Furthermore, the prior art of record fails to disclose associating the message with a default provider associated with a lowest priority when at least one of the plurality of higher prioritized providers does not recognize the message type. Therefore, the Examiner asserts that this feature is patentably distinct and non-obvious over the prior art.
